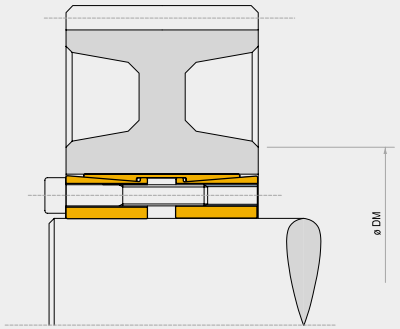
Locking assemblies self-centering

TLK 450 • TLK 451



TLK 450

Characteristics

Very high torques
Capacity to withstand bending moments
Standard sizes

Installation

Carefully clean the hub and shaft contact surfaces and apply a light oil film. Slide the locking assembly into the hub bore and insert the shaft. Tighten gradually and regularly in crossed sequence all screws up to 50% of the **Ms** value indicated in the table. Repeat the same operation by tightening all screws at the **Ms** torque indicated in the table.
Starting from the last tightened screw, check, in continuous sequence, that all the screws are tightened at the tightening torque Ms indicated. Repeat this procedure maximum twice. After this control any further operation is needed.
Do not use any oil with **molybdenum bisulphide** or high pressure additives and not grease. Above substances notably reduce the friction coefficient.

Dismantling

Loosen the clamping screws. Insert the screws into the dismantling threads of the front cone and tighten them gradually in crossed sequence up to 50% of the **Ms** value indicated in the table. Repeat the same operation by tightening the screws at the tightening torque **Ms** indicated in the table.
When the front cone is loose, to release the rear cone:
TLK450: keep tightening the screws and repeat the sequence above.
TLK451: insert the screws in the middle flange and repeat the same operation of the upper ring.

Tolerances, surface finish

A good surface finish by machine tool is sufficient.
Maximum allowable surface finish:
Rt max 16 µm (Ra 3 µm - Rz 13 µm)

Maximum permissible tolerances:
h8 for shaft
H8 for hub

DM hub calculation

For DM hub calculation see page 38.

ATTENTION: In case of reuse of the TLK451 check that the position of the dismantling threads of the front cone and middle flange are like in new pieces.

Locking assembly self-centering

For larger diameter or inch series please contact us.

NOTE: it is possible to reduce the screws tightening torque down to 60% of the values indicated in the above table; as a result Mt, Fass, Pw, Pn are reduced proportionally.

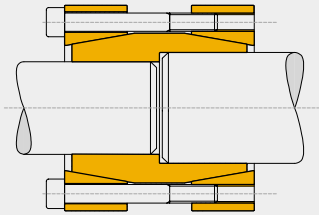
Standard version



Double diameter versions are available

TLK 500

Characteristics

Medium high torque
Restricted number of tightening screws
Easy installation
Application economically advantageous

Installation

Carefully clean the shafts contact surfaces. Fit the rigid coupling at the end of the connecting shafts. Tighten gradually and regularly in crossed sequence all screws to reach the tightening torque **Ms** indicated on the table.

Dismantling

By loosening all tightening screws the clamping cones are normally released. However in case of difficulties slightly hammer the released screws in a way to push back the rear pressure cone.

Tolerances, surface finish

A good surface finish by machine tool is sufficient. Maximum allowable surface finish:

Rt max 16 µm (Ra 3 µm - Rz 13 µm)

Maximum permissible tolerances:

h8 for shaft
